Placenta Previa

This program is designed for the second semester student caring for a non stable Obstetrical patient with placenta previa. Incorporated are the skills and medications necessary for caring for the obstetrical patient and the recognition of the possible implications of placenta previa.

Objectives:

1. Assessment and recognition of the signs and symptoms of an obstetrical patient with placenta previa
   a. Assess for hemorrhaging
   b. Assess for anxiety related to fetal status
   c. Assess for changes in cognitive of lethargy and/or confusion
   d. Assess vital signs
   e. Assess for knowledge deficit related to placenta previa

2. Initiate interdisciplinary collaboration in a hospital setting
   a. Report changes in the patient’s condition to the physician
   b. Implement new orders from physician
   c. Chart findings on appropriate charting sheets

3. Select appropriate interventions
   a. Start an IV
   b. Do vital signs
   c. Have patient sign a consent form
   d. Administer medications
   e. Prepare for a c section

4. Monitor therapeutic response to interventions (outcomes)
   a. Monitor amount of blood loss infection
   b. Monitor mentally alert and oriented
   c. Monitor that vital signs remain stable

Case Study: Noelle Sims is a 26 year old G2, P1 (2004) who is 37 weeks gestation. She awakened at 0200 thinking that she had wet the bed. When she arose she discovered her bed was covered in bright red blood. She called her obstetrician who directed her to go directly to the hospital. She was admitted to your labor and delivery unit with the admitting diagnosis of placenta previa.

Obstetrical History: This pregnancy has been uneventful up until this time. Her past pregnancy was also uneventful and she had a healthy 2681 gram baby girl.

What would you assess first?

What would be one of the first questions you would ask?

What would you not do?

After recording your assessment data (from your facilitator) proceed with your care.
